**TS: Windows HPC Server 2008, Configuring
and Managing**

Version 57.3

70-690

QUESTION NO: 1

You are a system administrator for your company. Your company has deployed a Windows HPC Server 2008 cluster. The HPC nodes are deployed by using a node template that is configured to deploy Windows HPC Pack on each node. You need to modify the node template so that HPC PowerShell and the HPC Cluster Manager are installed on the new nodes. What should you do?

- A. Install HPC PowerShell and the HPC Cluster Manager on the HPC head node. Recreate the node template by using the same settings.
- B. Add a Run OS Command task to the node template after the Install HPC Pack task. Configure the Run OS Command task to install the utilities.
- C. Add a Unicast Copy task to the node template before the Install HPC Pack task. Configure the Unicast Copy task to copy HPC PowerShell and the HPC Cluster Manager.
- D. Add a Unicast Copy task to the node template to copy the utilities. Add a Run OS Command task to the node template to install the utilities. Delete the original Install HPC Pack task.

Answer: D

QUESTION NO: 2

You administer a Windows HPC Server 2008 cluster. All jobs submitted to the cluster fail. You discover that the nodes communicate successfully. You need to ensure that the jobs can be submitted successfully. What should you do first?

- A. Start the HPC Basic Profile Web Service on all nodes.
- B. Start the HPC Cluster Manager and enable job Backfilling.
- C. Start the HPC Cluster Manager and run the MPI Lightweight throughput test.
- D. Start the HPC Cluster Manager and run the job submission diagnostics tool on all nodes.

Answer: D

QUESTION NO: 3

70-690

You administer a Windows HPC Server 2008 cluster for your company. You plan to configure a new node template to deploy the evaluation edition of Windows Server 2008 HPC Edition. You need to ensure that the deployment of nodes that use the template is successful. What should you do?

- A. Add a Tag element to the node XML file. Set the value of the attribute of the Tag element to Evaluation.
- B. Add a Template element to the node XML file. Set the value of the Name attribute to Evaluation.
- C. Add a Template element to the node XML file. Set the value of the Provisioned attribute to False.
- D. Add a Template element to the node XML file. Set the value of the ProductKey attribute to a valid Windows Server HPC Edition product key.

Answer: D

QUESTION NO: 4

You administer a Windows HPC Server 2008 cluster that has 150 nodes. Users report that cluster jobs take longer than normal to complete. You need to calculate the network latency between the nodes. What should you do?

- A. Run a serial ring test across all nodes by using the mpipingpong.exe utility.
- B. Run the ping command on all broker nodes by using the clusrun.exe utility.
- C. Run the etl2otf command on all nodes by using the mpiexec.exe utility.
- D. Run the etl2clog command on all broker nodes by using the mpiexec.exe utility.

Answer: A

QUESTION NO: 5

You administer a Windows HPC Server 2008 cluster. You have recently deployed 10 new nodes to the cluster. Users report that only seven of the new nodes function as part of the cluster. You discover that three new nodes are in the Unknown state. You need to find out the problem that has prevented the three nodes from joining the cluster. What should you do?

70-690

- A. Run the Connectivity diagnostics tool and view the results of the DNS Name Resolution test.
- B. Run the Connectivity diagnostics tool and view the results of the Internode Connectivity test.
- C. Run the System Configuration diagnostics tool and view the results of the Required Software Updates test.
- D. Run the System Configuration diagnostics tool and view the results of the Application Configuration test.

Answer: C

QUESTION NO: 6

You are a system administrator for your company. Your company deploys a new Windows HPC Server 2008 cluster. The company requires a record of performance information over time. The record must include link latency and throughput statistics. You need to periodically execute a command that collects the required information. Which command should you run?

- A. ping.exe
- B. nltest.exe
- C. mpipingpong.exe
- D. Get-HPCMetric.ps1

Answer: C

QUESTION NO: 7

You administer a Windows HPC Server 2008 cluster that has 120 compute nodes. The cluster requires 10 additional compute nodes. You manually install Windows Server 2008 Enterprise Edition on 10 new servers and connect them to the cluster networks. You open HPC Management Console, start the Add Node Wizard, and select an option to add preconfigured compute nodes. You discover that the wizard is unable to list any of the new servers. You need to ensure that all the new servers are available for the wizard. What should you do before you restart the wizard?

70-690

- A. Install HPC Pack 2008 on the new servers and specify the name of the head node.
- B. Create a node template that does not include a step to deploy an operating system image.
- C. Configure Windows Deployment Services to respond to all preboot execution environment (PXE) requests.
- D. Move the computer accounts for the new servers in the same organizational unit (OU) that contains the computer account of the head node.

Answer: A

QUESTION NO: 8

You administer a Windows HPC Server 2008 cluster. You plan to deploy new nodes to the cluster by using an existing node template. A folder and its files are stored on the head node. You need to ensure that the folder and its files are copied to each node by using the Server Message Block (SMB) protocol. Which task should you add to the node template?

- A. Unicast Copy
- B. Multicast Copy
- C. Mount Share
- D. Apply WIM Image

Answer: A

QUESTION NO: 9

You are deploying a Windows HPC Server 2008 cluster for your company. The cluster head node is configured with a network topology that has compute nodes isolated on a private network. You want to add new servers as compute nodes to the cluster. You open the HPC Management Console, start the Add Node Wizard, and select an option to add compute nodes from an operating system image. You start the new servers and discover that the wizard is unable to display any of the new servers on the

70-690

Select New Nodes page. You need to ensure that the new servers are displayed on the Select New Nodes page of the wizard. What should you do?

- A. Configure the network switches to support the cut-through switching method.
- B. Configure Windows Deployment Services on the head node to respond to all preboot execution environment (PXE) requests.
- C. Configure the compute node servers for preboot execution environment (PXE) boot from the NIC that is connected to the private network.
- D. Prestage computer accounts for the new servers in Active Directory Domain Services.

Answer: C

QUESTION NO: 10

You administer a Windows HPC Server 2008 cluster for your company. You plan to add new nodes to the cluster by using bare metal provisioning capabilities. You need to ensure the new nodes adhere to your company naming standards. What should you do?

- A. Add a naming series to the head node.
- B. Modify the NodeConfigurationFile.xsd file.
- C. Modify the NodeInfo.xml file to contain an appropriate name for each node.
- D. Create a new node template that contains an appropriate name for each node.

Answer: A

QUESTION NO: 11

You administer a Windows HPC Server 2008 cluster for your company. You plan to use a node XML file to specify the nodes that you want to add to the HPC cluster. You also plan to use a node template named Template1 to deploy the images. You need to configure the node XML file to specify the nodes that will be installed from bare metal. What should you do?

70-690

- A. Run the Add-HpclImage PowerShell cmdlet and specify the CPath option.
- B. Run the New-HpclImage PowerShell cmdlet and specify the CPath option.
- C. Add a Provisioned attribute to the Template element and set the Provisioned attribute to True.
- D. Add a Provisioned attribute to the Template element and set the Provisioned attribute to False.

Answer: A

QUESTION NO: 12

You administer a Windows HPC Server 2008 cluster that has 150 nodes. Some nodes are located in remote sites that do not have connectivity to port 3389 of the node. You need to develop a monitoring plan for events from all nodes including newly provisioned nodes. What should you do to view node events from all nodes?

- A. Use the Windows Event Viewer on each node.
- B. Run the diagnostic tests on all nodes by using the system diagnostics tool.
- C. View the events by using the Cluster Administration tool on the head node.
- D. View the operations log by using the Cluster Administration tool on the head node.

Answer: C

QUESTION NO: 13

You administer a Windows HPC Server 2008 cluster. You have recently deployed five new nodes to the cluster. You discover that after deployment, the Heat Map view for all nodes appears shaded and no metrics is reported. You need to ensure that the Heat Map view works correctly. What should you do?

- A. Delete and recreate the node template that is used to deploy new nodes.
- B. Stop and restart the hpcmanagement and hpcsdm services on the cluster head node.
