- A. Deferred firmware can be applied concurrently but contains updates that affect the

internal program load path, which are not activated until the next time the server is shut down and restarted.

B. Concurrent firmware must be done on all LPARs in the frame at the same time. Deferred firmware can be loaded on each LPAR at a different time and only becomes active when the LPAR is shutdown and restarted.

C. Deferred firmware can only be applied during an outage to the managed system as it will automatically shut the managed system down during its installation.

D. Concurrent firmware is only for minor fixes to the system microcode while deferred firmware contains major fixes to the service processor.
